16. ABSTRACT

Annual total phosphorus and total nitrogen loadings to the lake were estimated and subdivided according to either point or non-point source origin. An assessment of the lake's trophic condition and limiting nutrient is also provided. All data collected by the U.S.E.P.A. National Eutrophication Survey during the one year study of the lake and its tributaries are included in the report.

F O R E W O R D

The National Eutrophication Survey was initiated in 1972 in response to an Administration commitment to investigate the nationwide threat of accelerated eutrophication to fresh water lakes and reservoirs.

OBJECTIVES

The Survey was designed to develop, in conjunction with state environmental agencies, information on nutrient sources, concentrations, and impact on selected freshwater lakes as a basis for formulating comprehensive and coordinated national, regional, and state management practices relating to point-source discharge reduction and non-point source pollution abatement in lake watersheds.

ANALYTIC APPROACH

The mathematical and statistical procedures selected for the Survey's eutrophication analysis are based on related concepts that:

- a. A generalized representation or model relating sources, concentrations, and impacts can be constructed.
- b. By applying measurements of relevant parameters associated with lake degradation, the generalized model can be transformed into an operational representation of a lake, its drainage basin, and related nutrients.
- c. With such a transformation, an assessment of the potential for eutrophication control can be made.

LAKE ANALYSIS

In this report, the first stage of evaluation of lake and watershed data collected from the study lake and its drainage basin is documented. The report is formatted to provide state environmental agencies with specific information for basin planning {§303(e)}, water quality criteria/standards review {§303(c)}, clean lakes {§314(a,b)}, and water quality monitoring {§106 and §305(b)} activities mandated by the Federal Water Pollution Control Act Amendments of 1972.

Beyond the single lake analysis, broader based correlations between nutrient concentrations (and loading) and trophic condition are being made to advance the rationale and data base for refinement of nutrient water quality criteria for the Nation's fresh water lakes. Likewise, multivariate evaluations for the relationships between land use, nutrient export, and trophic condition, by lake class or use, are being developed to assist in the formulation of planning guidelines and policies by EPA and to augment plans implementation by the states.

ACKNOWLEDGMENT

The staff of the National Eutrophication Survey (Office of Research & Development, U. S. Environmental Protection Agency) expresses sincere appreciation to the Indiana State Board of Health for professional involvement, to the Indiana National Guard for conducting the tributary sampling phase of the Survey, and to those Indiana wastewater treatment plant operators who provided effluent samples and flow data.

The staff of the Division of Water Pollution Control, Indiana State Board of Health, provided invaluable lake documentation and counsel during the Survey, reviewed the preliminary reports, and provided critiques most useful in the preparation of this Working Paper series.

Major General Alfred F. Ahner, Adjutant General of Indiana, and Project Officers Lt. Colonel Charles B. Roberts (Retired) and Colonel Robert L. Sharp, who directed the volunteer efforts of the Indiana National Guardsmen, are also gratefully acknowledged for their assistance to the Survey.

GEIST RESERVOIR

STORET NO. 1811

I. CONCLUSIONS

A. Trophic Condition:

Survey data indicate that Geist Reservoir is eutrophic. It ranked 17th when the 27 Indiana lakes sampled in 1973 were compared using a combination of six parameters*. Nineteen of the lakes had less median total phosphorus, nine had less median dissolved phosphorus, 17 had less median inorganic nitrogen, 23 had less mean chlorophyll a, and 22 had greater mean Secchi disc transparency.

Survey limnologists noted emergent and submerged aquatic macrophytes at sampling station 2 and emergent macrophytes along parts of the shoreline.

B. Rate-Limiting Nutrient:

The algal assay results indicate that Geist Reservoir was limited by phosphorus at the time the sample was taken (05/10/73). The reservoir data indicate phosphorus limitation at all sampling times.

C. Nutrient Controllability:

1. Point sources--During the Survey sampling year, five point sources provided samples. In May of 1975, the Indiana Division of Water Pollution Control identified six additional point sources in

* See Appendix A.

the Fall River drainage, determined the phosphorus contribution of four of them, and provided the data for this report (Bon-Homme, 1976). The inclusion of the additional point-source loads permits a more realistic assessment of phosphorus controllability.

It is calculated that the phosphorus contribution of point sources accounted for 32.5% of the total load to Geist Reservoir. The Fortville wastewater treatment plant contributed 10.9%, the Indiana State Reformatory plant contributed 7.6%, and the Middletown plant contributed 6.1% of the total. The remaining six measured point sources collectively contributed 8.0% of the total phosphorus load. The loads from an elementary school and a church camp were not determined but probably were relatively insignificant compared to the measured sources.

The reservoir loading of $2.87 \text{ g/m}^2/\text{yr}$ is three times that proposed by Vollenweider (Vollenweider and Dillon, 1974) as a eutrophic loading (see page 15). However, the mean hydraulic retention time of the reservoir is a relatively short 58 days, and Vollenweider's model may not apply.

While even complete removal of phosphorus at the listed point sources would still leave a loading of $1.9 \text{ g/m}^2/\text{yr}$ (ca. twice the eutrophic loading), in view of the questionable applicability of Vollenweider's model and the phosphorus-limited condition of the reservoir, it is likely that a high degree of phosphorus removal at the significant point sources would result in improvement in

the trophic condition of the reservoir.

2. Non-point sources--The phosphorus contributions of non-point sources accounted for 67.2% of the total input to the reservoir. Fall Creek contributed 48.6%, and the remaining three sampled tributaries collectively contributed 12.5% of the total load. The ungaged tributaries were estimated to have contributed 5.5% of the total.

The phosphorus export rate of Dry Branch was a rather high 57 kg/km²/yr. The higher rate may be due in part to the unmeasured McCordsville Elementary School septic-tank load and in part to septic tank drainage from the community of McCordsville.

II. LAKE AND DRAINAGE BASIN CHARACTERISTICS[†]

A. Lake Morphometry^{††}:

1. Surface area: 7.28 kilometers².
2. Mean depth: 3.6 meters.
3. Maximum depth: 6.7 meters.
4. Volume: 26.208×10^6 m³.
5. Mean hydraulic retention time: 58 days.

B. Tributary and Outlet: (See Appendix C for flow data)

1. Tributaries -

<u>Name</u>	<u>Drainage area (km²)*</u>	<u>Mean flow (m³/sec)*</u>
Fall Creek	440.8	4.21
Dry Branch	19.7	0.18
Flatfork Creek	26.9	0.25
Thorpe Creek	24.6	0.23
Minor tributaries & immediate drainage -	<u>39.9</u>	<u>0.35</u>
Totals	551.9	5.22

2. Outlet -

Fall Creek	559.2**	5.22**
------------	---------	--------

C. Precipitation***:

1. Year of sampling: 122.0 centimeters.
2. Mean annual: 100.8 centimeters.

* For limits of accuracy, see Working Paper No. 175, "...Survey Methods, 1973-1976".

** Includes area of lake; outflow adjusted to equal sum of inflows.

*** See Working Paper No. 175.

III. LAKE WATER QUALITY SUMMARY

Geist Reservoir was sampled three times during the open-water season of 1973 by means of a pontoon-equipped Huey helicopter. Each time, samples for physical and chemical parameters were collected from a number of depths at two stations on the reservoir (see map, page v). During each visit, a single depth-integrated (4.6 m or near bottom to surface) sample was composited from the stations for phytoplankton identification and enumeration; and during the first visit, a single 18.9-liter depth-integrated sample was composited for algal assays. Also each time, a depth-integrated sample was collected from each of the stations for chlorophyll a analysis. The maximum depths sampled were 4.3 meters at station 1 and 6.1 meters at station 2.

The sampling results are presented in full in Appendix D and are summarized in the following table.

A. SUMMARY OF PHYSICAL AND CHEMICAL CHARACTERISTICS FOR GEIST RESERVOIR

05/10/73	1	54.2
	2	34.9
08/02/73	1	94.1
	2	17.4
10/15/73	1	70.4
	2	4.7

C. Limiting Nutrient Study:

1. Autoclaved, filtered, and nutrient spiked -

<u>Spike (mg/l)</u>	<u>Ortho P Conc. (mg/l)</u>	<u>Inorganic N Conc. (mg/l)</u>	<u>Maximum yield (mg/l-dry wt.)</u>
Control	0.015	2.380	3.4
0.050 P	0.065	2.380	20.6
0.050 P + 1.0 N	0.065	3.380	21.8
1.0 N	0.015	3.380	2.9

2. Discussion -

The control yield of the assay alga, Selenastrum capricornutum, indicates that the potential primary productivity of Geist Reservoir was moderately high at the time the sample was taken (05/10/73). Also, a six-fold increase in yield with the addition of only phosphorus indicates the reservoir was phosphorus limited at that time. Note that the addition of only nitrogen resulted in a yield not significantly different from that of the control.

The reservoir data also indicate phosphorus limitation; i.e., the mean inorganic nitrogen to orthophosphorus ratios were 17 to 1 or greater at all sampling times, and phosphorus limitation would be expected.

IV. NUTRIENT LOADINGS (See Appendix E for data)

For the determination of nutrient loadings, the Indiana National Guard collected monthly near-surface grab samples from each of the tributary sites indicated on the map (page v), except for the high runoff months of February and March when two samples were collected. Sampling was begun in June, 1973, and was completed in May, 1974.

Through an interagency agreement, stream flow estimates for the year of sampling and a "normalized" or average year were provided by the Indiana District Office of the U.S. Geological Survey for the tributary sites nearest the reservoir.

Except for Flatfork Creek, nutrient loads for sampled tributaries were determined by using a modification of a U.S. Geological Survey computer program for calculating stream loadings*. The phosphorus load measured in Flatfork Creek at station C-1 was less than the Fortville wastewater treatment plant load, and the non-point nutrient loads of this stream were estimated (see below). The Fall Creek nutrient loads shown are those measured minus the point-source loads.

Nutrient loads for Flatfork Creek and unsampled "minor tributaries and immediate drainage" ("ZZ" of U.S.G.S.) were estimated using the nutrient loads at station D-1, in kg/km²/year, and multiplying by the Flatfork Creek and ZZ areas in km².

* See Working Paper No. 175.

The operators of the Indiana State Reformatory, Pendleton, Middletown, Fortville, and Shenandoah High School wastewater treatment plants provided monthly effluent samples and corresponding flow data.

The estimated phosphorus load from septic tanks was reduced by 50% to adjust for a phosphate detergent ban which has been in effect in Indiana since January, 1972.

A. Waste Sources:

Pentecostal Camp	?	-
d. Septic tanks* -	55	0.3
e. Known industrial -		
E. I. DuPont Nemours	60	0.3
Brookside Corp.	540	2.6
Forthrite Div.	20	<0.1
f. Direct precipitation** -	<u>125</u>	<u>0.6</u>
Total	20,945	100.0

2. Outputs -

Lake outlet - Fall Creek 12,625

3. Net annual P accumulation - 8,320 kg.

* Estimate based on 1970 Census of Ingalls and 38 lakeshore dwellings; see Working Paper No. 175.

** See Working Paper No. 175.

C. Annual Total Nitrogen Loading - Average Year:

1. Inputs -

<u>Source</u>	<u>kg N/ yr</u>	<u>% of total</u>
a. Tributaries (non-point load) -		
Fall Creek	444,795	66.8
Dry Branch	36,200	5.4
Flatfork Creek	45,435	6.8
Thorpe Creek	41,545	6.2
b. Minor tributaries & immediate drainage (non-point load) -	67,390	10.1
c. Known domestic STP's -		
Indiana State Reformatory	2,850	0.4
Pendleton	3,750	0.6
Middletown	5,155	0.8
Fortville	6,390	1.0
Regency MHP	?	-
Shenandoah High School	20	<0.1
McCordsville Elem. Sch.	?	-
Pentecostal Camp	?	-
d. Septic tanks* -	4,190	0.6
e. Known industrial -		
E. I. DuPont Nemours	?	-
Brookside Corp.	?	-
Forthrite Div.	?	-
f. Direct precipitation** -	<u>7,860</u>	<u>1.2</u>
Total	665,580	100.0

2. Outputs -

Lake outlet - Fall Creek 681,175

3. Net annual N loss - 15,595 kg.

* Estimate based on 1970 Census of Ingalls and 38 lakeshore dwellings; see Working Paper No. 175.

** See Working Paper No. 175.

D. Mean Annual Non-point Nutrient Export by Subdrainage Area:

<u>Tributary</u>	<u>kg P/km²/yr</u>	<u>kg N/km²/yr</u>
Fall Creek	23	1,009
Dry Branch	57	1,838
Thorpe Creek	29	1,689

E. Yearly Loads:

In the following table, the existing phosphorus loadings are compared to those proposed by Vollenweider (Vollenweider and Dillon, 1974). Essentially, his "dangerous" loading is one at which the receiving water would become eutrophic or remain eutrophic; his "permissible" loading is that which would result in the receiving water remaining oligotrophic or becoming oligotrophic if morphometry permitted. A mesotrophic loading would be considered one between "dangerous" and "permissible".

Note that Vollenweider's model may not be applicable to water bodies with short hydraulic retention times.

	Total Phosphorus		Total Nitrogen	
	Total	Accumulated	Total	Accumulated
grams/m ² /yr	2.88	1.14	91.4	loss*

Vollenweider phosphorus loadings
(g/m²/yr) based on mean depth and mean
hydraulic retention time of Geist Reservoir:

"Dangerous" (eutrophic loading)	0.92
"Permissible" (oligotrophic loading)	0.46

* There was an apparent nitrogen loss during the sampling year. This may have been due to nitrogen fixation in the reservoir, solubilization of previously sedimented nitrogen, recharge with nitrogen-rich ground water, or unknown point sources discharging directly to the reservoir. Whatever the cause, a similar loss has occurred at Shagawa Lake, Minnesota, which has been intensively studied by EPA's former National Eutrophication and Lake Restoration Branch (Malueg et al., 1975).
